

Broadmore Juniper

Juniperus sabina

- Conifer, evergreen, shrub, low spreading, mounded form, 18 inches (45 cm) high (to 3 ft when old) by 10 ft (3 m) across, branches horizontal and layered on each other, branchlets crowded, tend to arise from upper 30° of a branch. Leaves scale-like (4 ranked), sharp tipped, out spreading, dorsal gland, and on older branchlets, awl-shaped needles, 2-3 mm long, blue-green. Like other *J. sabina*, leaves emit an unpleasant odor when crushed; difficult to detect in cold weather.
- Sun. Adaptable. Does well on limestone soil and well-drained and dry soils. Tolerates city conditions.
- Found in the wild on the mountains in Southern Europe, and may deserve the botanical categorization of variety.
